VISIBLE DATA – INVISIBLE DISPARITIES
the politics of research data management in Switzerland

By building on existing experiences, resources and tools available within Switzerland, the DLCM project contributes to move beyond the competition and politics among higher education to focus on the essential: making the data visible, while preventing disparities among institutions and helping to provide sustainable organizational strategies and technical developments to promote data availability, discoverability, and reusability nationally. This dynamic exchange of best practices and recommendations allows moving beyond the politics of each institution to focus on a national priority: harmonizing and strengthening research data management practices across the research and information professions and all sectors (disciplines, universities, foundations, and non-profit institutions).
